

### Git Repository:

<https://git.fhict.nl/1540432/rss-feed-viewer.git>

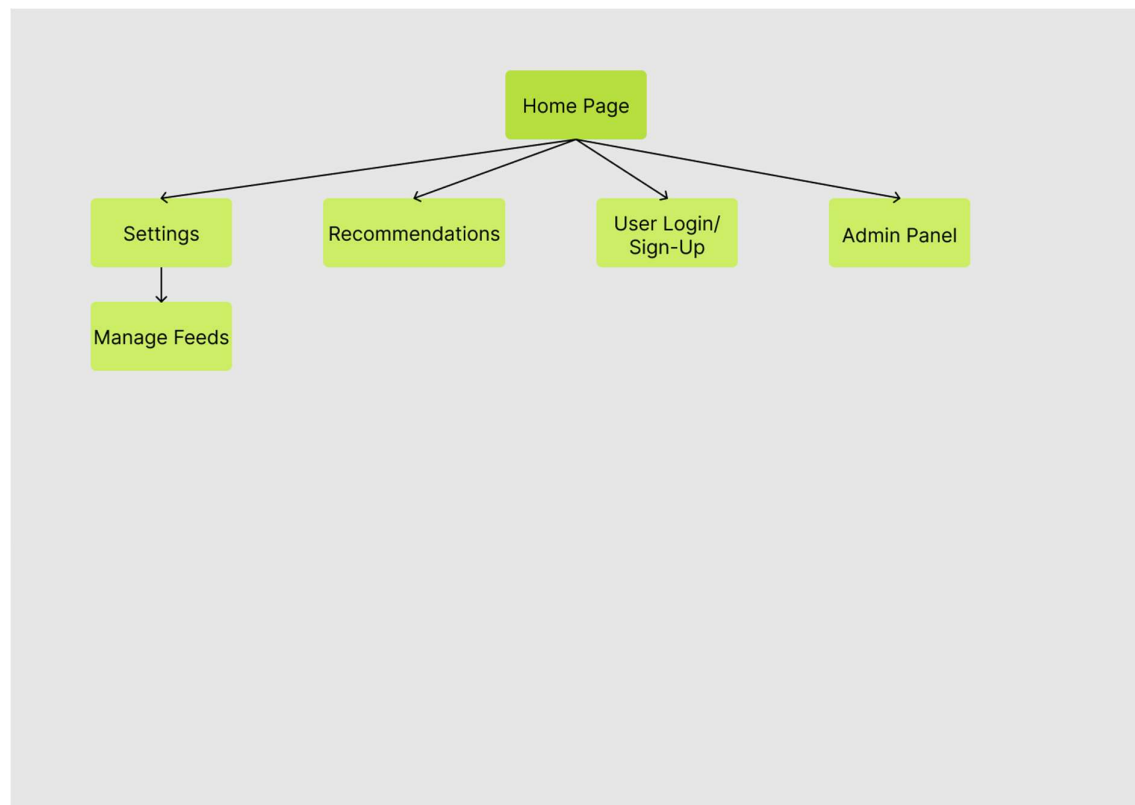

### Short Description:

The applications purpose will be to view RSS feeds all in one place. The <content> will be RSS Feeds. The content I will be able to add as an admin will be new fields and maybe new parsers for the incoming XML documents. For an expansion on the <content> I was thinking I could add Ratings for each feed and maybe Reviews.

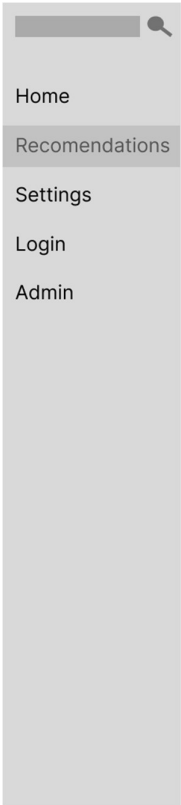

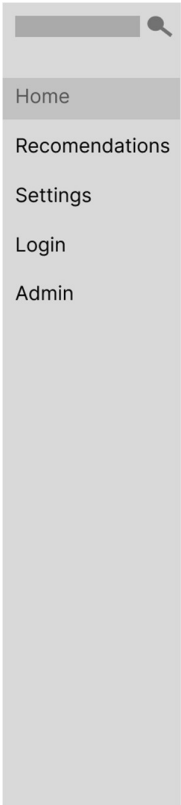

For the algorithm Learning Point I will have a recommendation page based on the categories, ratings and eventually other users with similar tastes in Feeds.

The Data I will store in my own database should range from info on the RSS feeds (source, reviews, ratings, etc.) to eventually data on users (Feeds they subscribe too, username, password, email, some kind of information for a recommendation algorithm).
